

What's New in the R3000 '1.10.30' Version

This newest release of software for the R3000 Enterprise Filter requires an R3000 unit running software version 1.10.20 or later.

IMPORTANT NOTICE: *8e6 recommends applying the 1.10.30 software at a time when a brief outage in filtering would be acceptable, as an approximate 5-minute outage in R3000 filtering services will occur when executing this upgrade. After this software upgrade is applied, the R3000 will automatically reboot itself.*

Enhancements and New Feature

- The Backup Server Configuration option is now available for all LDAP server configurations. This feature, formerly used for Novell eDirectory server configuration, is located on the Default Rule tab.
- Several bug fixes that enhance the performance and accuracy of the HTTPS Medium and High filtering settings.
- Backend changes required for the upcoming Active Directory Agent. The Active Directory Agent is another means of authenticating users to an Active Directory server. While all backend processes are ready for general release, the Active Directory Agent itself is currently in beta. Information on participating in the beta program for the Active Directory Agent is available from our technical support department.
